

Kapitel 1

Introduction

The comparison of early photographs of galaxies with modern exposures leads to the assumption that we have to deal with static objects with no evolution at all. Indeed there is a development which takes place on time scales too long for us to take any notice of it within the life time of man. Physical considerations lead to an estimation of orders of magnitude of time scales for processes determining the evolution. In this work time scales for some important processes will be estimated in chapter 2.3. In order to get an idea of the different stages of evolution one can compare a sample of objects of different ages. The development can thus be reconstructed. An important tool is the simulation of physical processes taking place to put the observed stages of evolution into a plausible background. In the past various methods have been developed from which one will be presented in chapter 2.4.2. Applying this scheme to a certain starting model allows the study of different stages of evolution. The construction of a starting model is a serious problem though. The Milky-Way containing our solar system is a disc galaxy consisting of three major components which are introduced in chapter 2.2.2. The starting model will be similar to this complicated stellar system. In order to obtain a starting model satisfying the criteria of stability introduced in chapter 3.1.4 theoretical background will be given in chapter 3.1 (chapter 3.2).

The aim of this work is to study the evolution of interacting galactic systems. In order to identify the influence of the interaction non interacting (isolated) systems will be studied first. The stability of the starting model with two modifications is tested in chapter 3.4. The orbits of stars will be calculated by solving the equations of motion obtained by the gravitational law numerically. In addition a gaseous component is implemented following further physical laws. Realizing these laws will be introduced in chapter 3.5.

chapter 4 deals with the interaction of a disc galaxy with a dwarf galaxy in detail. In this context this dwarf galaxy is often referred to as a satellite galaxy or a companion. The results are discussed in the context of a physical background. In addition a study has been conducted comparing an observed sample of *edge-on*-galaxies with a sample of simulations. In chapter 3.6.1 and chapter 4.4.1 the development of the vertical structure in the run of the interaction will be studied.

The main point of this work is the development of a procedure simulating star formation being introduced in chapter 5. The own character of this procedure lies in the fact that many different ideas from authors like OLSON & KWAN (ApJ **349**, 480 (1990)) have been taken. With this method studies are performed investigating the star formation rate and dynamic of the gas component for isolated and for interacting systems. The most important results are summarized in chapter 7.

Inhaltsverzeichnis

1	Einleitung	1
2	Einführung	3
2.1	Die Milchstraße	3
2.2	Allgemeines zu Galaxien	4
2.2.1	Elliptische Galaxien	5
2.2.2	Spiralgalaxien	6
2.2.3	Zwerggalaxien	10
2.3	Zeitskalen stellarer Systeme	12
2.4	Numerische Simulationsmethoden	15
2.4.1	Problemstellung	15
2.4.2	TREE-Code	16
2.5	Stand der Forschung	17
3	Simulation isolierter Scheibengalaxien	23
3.1	Theoretische Grundlagen	23
3.1.1	Jeans-Theoreme	24
3.1.2	Das Plummer-Modell	25
3.1.3	Der Virialsatz	26
3.1.4	Strukturelle Instabilitäten	27
3.2	Konstruktion eines Anfangsmodells	28
3.2.1	Die Bulge-Komponente	29
3.2.2	Die Halo-Komponente	30
3.2.3	Die Scheiben-Komponente	30
3.3	Eigenschaften des Anfangsmodells	31
3.4	Untersuchung der Stabilität des Anfangsmodells	33
3.4.1	Isolierte Scheibengalaxie mit dynamischem Halo	34
3.4.2	Isolierte Scheibengalaxie mit statischem Halo	37
3.5	Dissipation im TREE-Code	42
3.5.1	Stoßmechanismus	43
3.5.2	Dissipative Kühlung und dissipationsinduzierte Heizung	46

3.5.3	Ablauf der Dissipation	50
3.6	Andere Anfangsmodelle	53
3.6.1	Parameterstudie zur Anfangsdicke der Scheibe	54
4	Das Verschmelzen von Satelliten mit Spiralgalaxien	57
4.1	Die Anfangskonfiguration	57
4.1.1	Die isolierte Satellitengalaxie	57
4.1.2	Positionierung des Satelliten	58
4.1.3	Übersicht der Modelle mit Satellitenwechselwirkung	59
4.2	Modell einer Wechselwirkung mit statischem Halo	59
4.2.1	Dynamische Reibung	59
4.2.2	Die Auswirkung eines induzierten Drehmomentes	62
4.2.3	Die Bahn des Satelliten	62
4.2.4	Der Tidenradius	63
4.2.5	Entwicklung der Satellitenstruktur	65
4.2.6	Einfluß der Wechselwirkung auf die Scheibenstruktur	65
4.3	Modell einer Wechselwirkung mit dynamischem Halo	68
4.3.1	Einfluß der Wechselwirkung auf die Gasdynamik	70
4.4	Andere Anfangsmodelle	72
4.4.1	Modelle mit unterschiedlichen Scheibenstrukturen	72
4.4.2	Modelle mit unterschiedlichen Satellitenstrukturen	77
5	Sternentstehung	83
5.1	Implementierung von Sternentstehung	83
5.1.1	Sternentstehungskriterium	83
5.1.2	Durchführung von Sternentstehung	85
5.2	Diskussion der vorgestellten Methode	88
5.3	Isolierte Galaxienmodelle mit Sternentstehung	89
5.4	Satellitenwechselwirkung mit Sternentstehung	97
5.5	Andere Anfangsmodelle	105
6	Übersichtstabelle aller Simulationsmodelle	109
7	Zusammenfassung und Ausblick	111
8	Anhang	115
8.1	Erhaltung des Bahndrehimpulses bei Sternentstehung	115
	Literaturverzeichnis	117
